

# Vaccinations for pregnant women

**Pregnancy means you are more at risk from certain infections. Vaccinations help you stay healthy.**

Your immunity passes directly to your baby, giving them vital protection in their first few months of life.

The vaccinations recommended in pregnancy are:

- **Whooping cough** (pertussis) vaccine from 16 weeks
- **RSV** (respiratory syncytial virus) from 28 weeks
- Seasonal vaccines like **flu** at any stage of pregnancy

Talk to your midwife or GP today to learn more and book your vaccination.

# Vaccinations for babies and children aged 0–5

**We all want to give our children the best start in life. Protecting them from illness through immunisation helps them to stay healthy and thrive as they grow.**

Vaccinations are safe and effective. They protect children from serious and life-threatening illnesses like whooping cough (pertussis), polio, hepatitis B, rotavirus, measles, mumps, rubella and meningococcal group B disease (MenB) and more.

**Your GP will contact you when your child's immunisations are due.**
